(54)SURFACE TREATING METHOD FOR INK JET RECORDING HEAD

(57) Abstract:

PURPOSE: To improve durability of a film by coating an ink jet orifice surface with resin filled in particles having thermoplastic resin adding filler structure, and repellency agent.

coated with resin composition in which without reducing water repellency continuity. inorganic or organic fine particles are filled in amorphous thermoplastic resin having COPYRIGHT: (C)1995,JPO

perfluoro structure. As the polymer compound having the perfluoro structure, amorphous having thermoplastic resin perfluoroheterocycle structure is used. As the therein, filled inorganic filler to be titanium oxide, aluminum oxide, etc., is used, composition in which inorganic or organic fine and as the organic filler, polyacrylamide, amorphous etc., is used. Then, a surface treating method perfluoro adds to disperse perfluoro compound soluble liquid in specific solvent or fluorine-containing compound insoluble in solvent in perfluoro compound soluble in general organic solvent CONSTITUTION: An ink jet orifice surface is thereby to improve its mechanical strength
